

**PANEL HANDLING**

Wieser's "Swift Lift" Panel Lifting System assures safe and easy handling of panels. The lifting lugs are attached to the panel's reinforcement and recessed in the panel's edge, out of view after the panel is installed.

**INSULATED PANEL LAMINATION CONNECTION**

Stainless steel sleeves, together with steel reinforcing, secure the "Insulated Sandwich Concrete Panel" together. In addition, stainless steel "Hair-pins" (not shown) are imbedded into the edges of both layers of concrete. This system allows for expansion and contraction with weather changes. Also, the edge to edge foam board insulation provides a true R factor value.

**PANEL FASTENERS**

Recessed weld plates, imbedded in the panels edges, are used to fasten panels together.

**PANEL JOINT SEALANT**

Wall panel joints are caulked with Dymeric sealant over a polyethylene backing to provide a moisture proof joint.
